

A refinery in Papua New Guinea requested that KBC Environmental undertake an Environmental Audit in order to comply with local regulatory requirements, and an assessment of environmental liabilities for insurance and to comply with International Accounting Standards (IAS).

Our Approach

KBC initially undertook a desktop study to review information pertaining to the environmental setting and environmental management at the refinery. This was followed by a site walkover and interviews with the management and HSE personnel at the refinery to identify potential areas of environmental concern.

Project Outcomes

The Environmental Liability Assessment Report included a detailed breakdown of expenditure likely to be required to bring the refinery up to international best practice standards for environmental management, and also an estimate of potential future liability if the refinery were to cease activities in 2030.
